Position in CSS

Assignment Q5

Q5) What is the Z-index in CSS? Explain with using Code.

Ans: -

1. The z-index property specifies the stack order of an element.

2. An element with greater stack order is always in front of an element with a lower stack order.

3. z-index only works on positioned elements (position: absolute, position: relative, position: fixed, or position: sticky) and flex items (elements that are direct children of display:flex elements).

4. If two positioned elements overlap without a z-index specified, the element positioned last in the HTML code will be shown on top.

Code in CSS for Z-index is

```
img {

        position: absolute;
        left: 0px;
        top: 0px;
        z-index: -1;
}
```
